

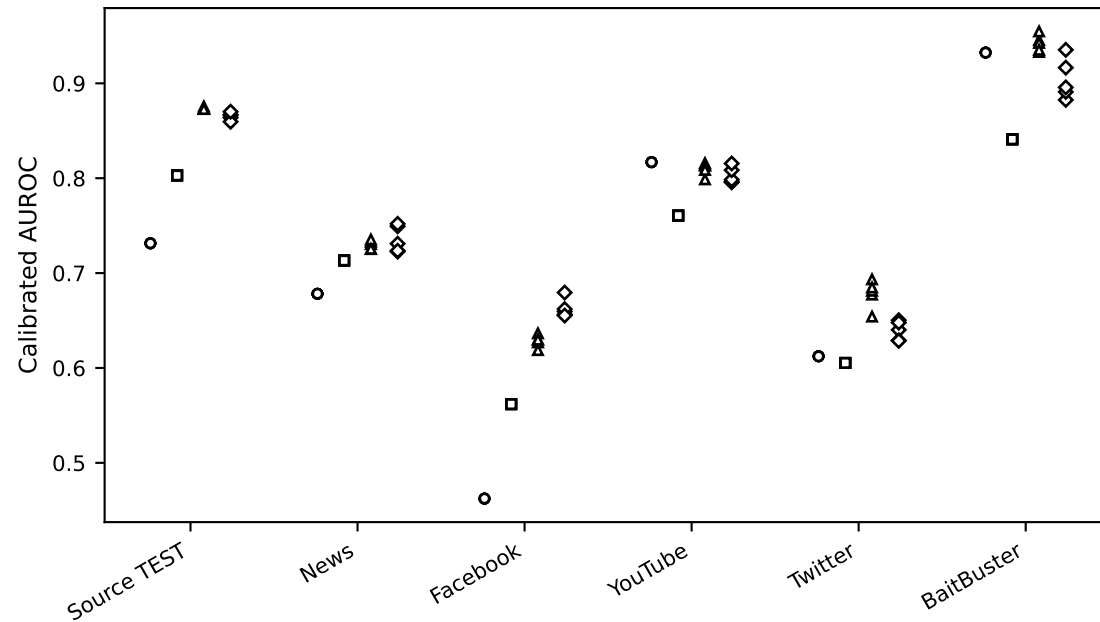

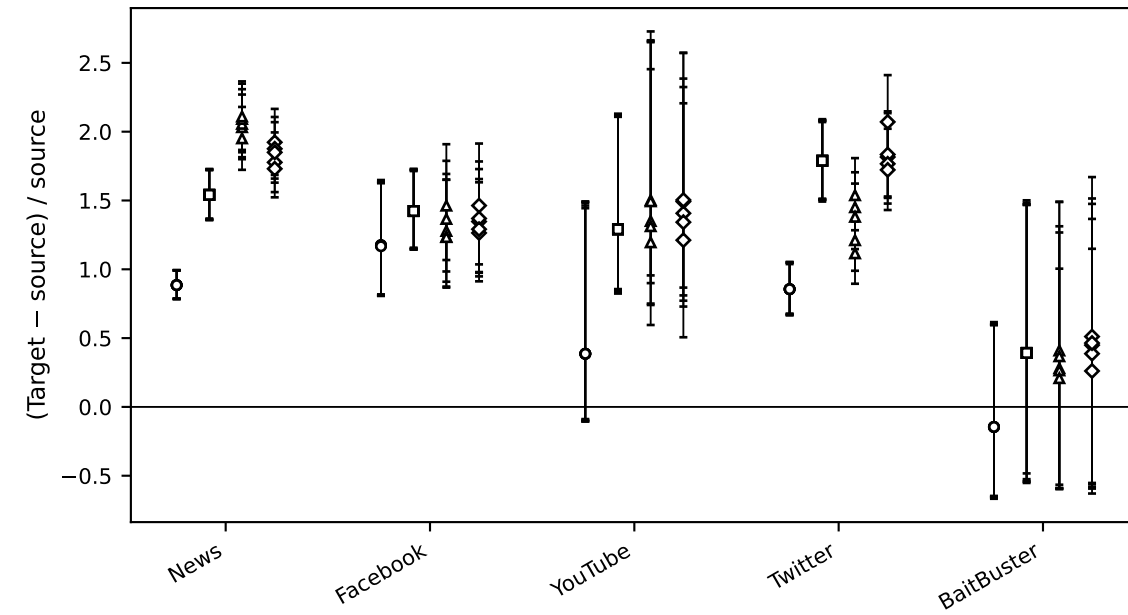

Figure 2. Cross-platform discrimination and probability reliability

Model
 ○ EBM □ TF-IDF LR ▲ BanglaBERT ◇ XLM-R

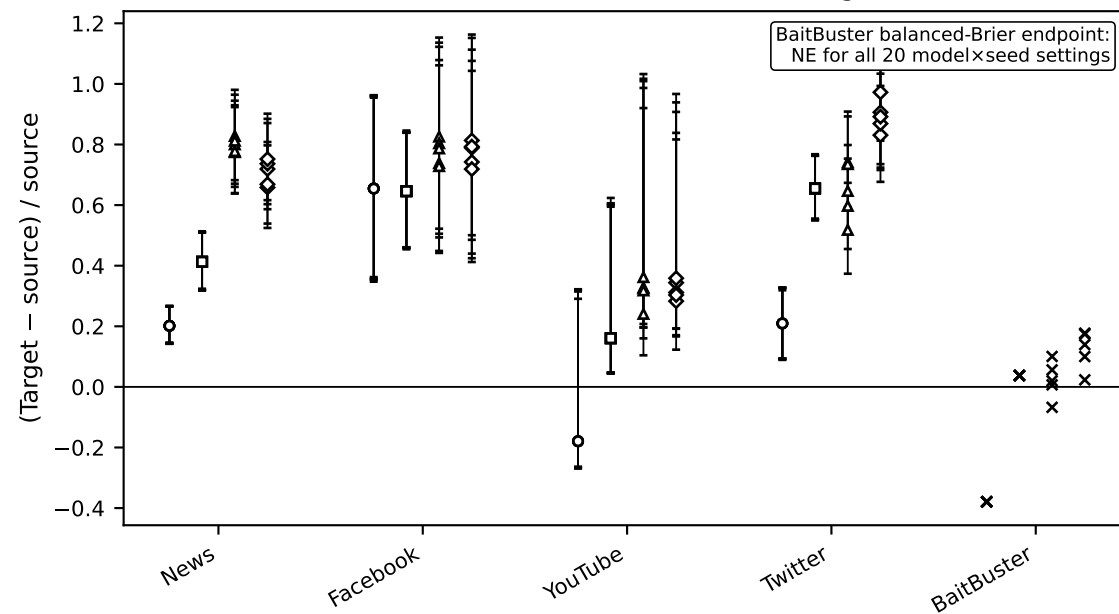

A. Canonical calibrated discrimination (model×seed points)

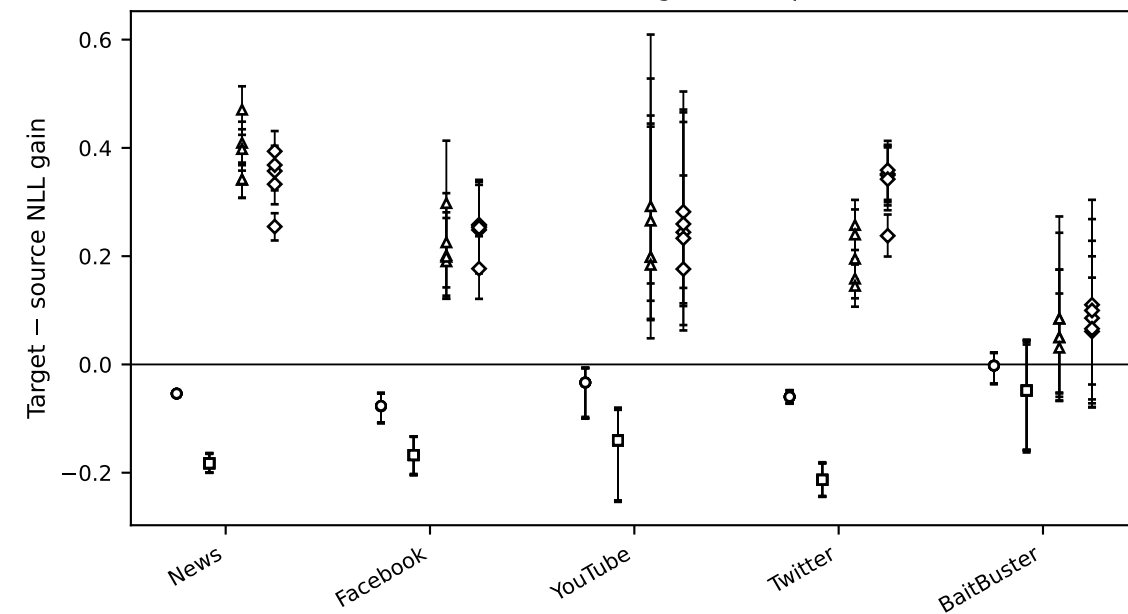

B. H1 relative NLL change

C. H1 relative balanced-Brier change

D. H2 calibration-gain transport

BaitBuster overall H1 inference is non-estimable because AUROC and balanced-Brier bootstrap endpoints are incomplete under the locked procedure.
